Research Summary

A micro-mesh nebulizer is a type of medical device used for the delivery of medication in aerosol form to patients with respiratory conditions such as asthma, chronic obstructive pulmonary disease (COPD), or cystic fibrosis. It consists of a small, vibrating mesh membrane with micro-sized holes that generate a fine mist or aerosol when medication is pushed through the mesh by means of an attached ultrasonic or vibrating mechanism. This fine mist can then be inhaled directly into the lungs by the patient using a mouthpiece or mask. Micro-mesh nebulizers are known for their efficiency in producing a consistent particle size distribution, allowing for optimal drug delivery to the lungs, and are often preferred by patients due to their quiet operation and portability. They are commonly used in both clinical settings and for at-home treatment of respiratory conditions.
