### Research Summary

Microcrystalline cellulose (MCC) is a refined, partially depolymerized form of cellulose derived from natural sources, such as wood pulp or plant fibers. It is a white, odorless, tasteless powder with excellent flow properties and is widely used in various industries, including pharmaceuticals, food, cosmetics, and personal care. MCC is composed of small, crystalline particles with a high surface area, which provides it with several desirable properties, such as high compressibility, binding capacity, and bulk density. In pharmaceutical applications, MCC is commonly used as a filler, binder, and disintegrant in the formulation of tablets and capsules. Its ability to absorb liquids, swell, and form a cohesive matrix aids in the controlled release of drugs. In the food industry, MCC is used as a texturizer, anti-caking agent, and fat substitute, among other functions. It offers improved mouthfeel, stability, and bulking properties in food products. MCC is generally regarded as safe for consumption and provides a versatile and valuable ingredient in a wide range of industries.

The major global manufacturers of Microcrystalline Cellulose (MCC) include FMC, JRS,
