Research Summary

Micronized polyethylene wax refers to a form of polyethylene wax that has undergone the micronization process, resulting in a fine and powdery particle size. Polyethylene wax is a synthetic wax derived from petroleum or natural gas, known for its low melting point, hardness, and lubricating properties. Micronization is a technique that breaks down the polyethylene wax particles into smaller sizes, typically in the micron range, to improve its dispersibility and enhance its performance in various applications. The micronized polyethylene wax particles are often spherical or irregularly shaped. This form of wax is commonly used as an additive or ingredient in industries such as coatings, inks, adhesives, rubbers, plastics, and personal care products. It acts as a lubricant, dispersing agent, flow promoter, and matting agent, providing benefits such as improved scratch resistance, anti-blocking properties, matting effect, and enhanced surface finish. The small particle size of micronized polyethylene wax allows for better compatibility and distribution within different formulations, leading to improved product performance and desired effects.

The major global manufacturers of Micronized Polyethylene Wax include Clariant, BASF, Honeywell, Lubrizol, Deuteron, Ceronas, Shamrock Technologies, MUNZING, Shanghai Jiaoer Wax, Nanjing Tianshi New Material, Jiangxi Longhai Chemical, Kunshan Xinkui Chem, etc. The global players competition landscape in this report is divided into three tiers.
