Research Summary

A microprocessor is a central processing unit (CPU) that contains the functions of a computer's arithmetic logic unit (ALU), control unit, and register array on a single integrated circuit (IC) or chip. It serves as the "brain" of a computer or electronic device, executing instructions and performing calculations. Microprocessors are capable of processing vast amounts of data at high speeds and are responsible for carrying out instructions provided by software. They handle tasks such as executing program instructions, performing mathematical operations, managing memory, controlling input/output devices, and facilitating communication between different hardware components. Microprocessors come in various architectures and are used in a wide range of devices, including personal computers, smartphones, gaming consoles, embedded systems, and many other electronic devices.

The major global manufacturers of Microprocessor include Intel, Qualcomm, AMD, Freescale, Nvidia, TI, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command
