### Research Summary

Microtomes are precision instruments used in histology and pathology laboratories to prepare thin sections of tissues for microscopic examination. These instruments enable researchers, histotechnologists, and pathologists to study the cellular and structural details of tissues with high magnification. Microtomes work by securely holding a tissue sample and moving it across a sharp blade or knife to produce thin slices. The thickness of the slices can be adjusted to meet specific requirements. Microtomes may be manual, where the user manually advances the sample, or motorized, where an automated mechanism moves the sample. The sections cut by microtomes are typically mounted on slides, stained, and then examined under a microscope for analysis. Microtomes play a crucial role in various fields, including medical research, diagnostics, and education, allowing for detailed examination and accurate diagnosis of diseases and abnormalities.

The major global manufacturers of Microtomes include Leica, Sakura, Thermo Fisher, Medite, Slee Medical, RMC Boeckeler, MICROS Austria, AGD Biomedicals, Alltion,

Amos scientific, Bright Instrument, Diapath Spa, Histo Line Laboratories, Auxilab, Nanolytik, Orion Medic, S.M.
