Research Summary

Mid-infrared (mid-IR) lasers are a type of laser that emits coherent light in the mid-infrared wavelength range, typically spanning from approximately 2 to 20 micrometers. These lasers are designed to operate within this specific wavelength range, where many important molecular vibrations and absorptions occur. Mid-IR lasers offer unique capabilities for various applications, including spectroscopy, chemical sensing, medical diagnostics, remote sensing, and defense applications. They are known for their ability to interact with specific chemical bonds and molecular structures, providing valuable information about the composition and properties of materials. Mid-IR lasers utilize different laser technologies, such as quantum cascade lasers (QCLs), optical parametric oscillators (OPOs), or tunable solid-state lasers, to generate coherent and high-power mid-infrared light. The development of reliable and efficient mid-IR laser sources has opened up numerous possibilities for scientific research, industrial applications, and technological advancements.

The major global manufacturers of Mid-infrared Lasers include IPG Photonics, Daylight
