### Research Summary

Milk replacer, also known as milk substitute, is a specially formulated product designed to provide a nutritional alternative to mother's milk for young animals, particularly newborns or orphaned animals. It is commonly used in the rearing of animals such as calves, lambs, piglets, and foals when the natural milk supply from their mothers is unavailable or insufficient. Milk replacers typically contain a combination of various ingredients such as milk proteins, fats, carbohydrates, vitamins, minerals, and additives to mimic the composition and nutritional profile of the mother's milk as closely as possible. They are available in powder or liquid form and are reconstituted with water before feeding. Milk replacers provide essential nutrients for growth and development, including proteins for muscle and tissue development, fats for energy, carbohydrates for digestion, and vitamins and minerals for overall health. They play a crucial role in ensuring the survival and healthy development of young animals during the crucial early stages of life.
