Research Summary

A millimeter wave absorber is a specialized material designed to attenuate or absorb electromagnetic waves within the millimeter wave frequency spectrum, typically ranging from 30 GHz to 300 GHz. These absorbers are engineered to minimize the reflection, transmission, or scattering of millimeter waves, thereby reducing electromagnetic interference (EMI) and controlling the propagation of signals in various applications such as telecommunications, radar systems, imaging technologies, and wireless networks. They are composed of materials with high absorption properties, often utilizing dielectric or magnetic loss mechanisms to effectively dissipate the energy of incoming millimeter wave signals. Millimeter wave absorbers are essential for optimizing the performance and reliability of millimeter wave-based devices, ensuring efficient signal management and minimizing potential interference in sensitive electronic systems.
