Research Summary

Mineral water refers to natural water that is sourced from underground mineral springs and contains various minerals and trace elements. It is distinct from regular tap water or purified water due to its natural mineral content, which is often the result of the water passing through layers of rock and soil, picking up minerals along the way. The mineral composition of mineral water can vary depending on the source, but common minerals found include calcium, magnesium, potassium, and bicarbonate. These minerals can give mineral water a distinctive taste and contribute to its perceived health benefits.
