Research Summary

MIS Sacroiliac Joint Fusion, also known as Minimally Invasive Sacroiliac Joint Fusion, is a surgical procedure performed to treat sacroiliac joint dysfunction. The sacroiliac joint, located between the sacrum and ilium bones in the pelvis, can become painful and dysfunctional due to various reasons such as arthritis, injury, or pregnancy-related changes. MIS Sacroiliac Joint Fusion involves stabilizing the joint by using a minimally invasive surgical approach. During the procedure, small incisions are made, and specialized instruments are used to place implants or bone grafts across the sacroiliac joint to promote fusion and increase stability. The minimally invasive technique aims to reduce tissue damage, postoperative pain, and recovery time compared to traditional open surgery. MIS Sacroiliac Joint Fusion can help alleviate pain, improve joint function, and enhance the patient's overall quality of life. However, as with any surgical procedure, the risks and benefits should be discussed with a healthcare professional before determining the appropriateness of this treatment option.
