### Research Summary

Mobile patient lifts are assistive devices used in healthcare settings to safely transfer and transport individuals with limited mobility, such as patients with disabilities or the elderly. These lifts consist of a sturdy frame with wheels, a lifting mechanism, and various support components. The lifting mechanism typically utilizes an electric or hydraulic system to raise and lower the patient, and the support components include slings or harnesses that securely hold the individual during the transfer process. Mobile patient lifts offer flexibility and ease of use, allowing caregivers to navigate easily within healthcare facilities and transfer patients between different areas, such as beds, chairs, or baths.
