### Research Summary

Molecular sieve adsorbents are highly porous materials with the ability to selectively adsorb or trap specific molecules or gases based on their size, shape, and polarity. They consist of crystalline structures, typically made from metal-aluminosilicate compounds. The extended network of pores within molecular sieve adsorbents allows for the controlled adsorption and desorption of molecules. By choosing the appropriate pore size and chemical composition, these materials can effectively separate and purify gases or liquids by selectively adsorbing the desired molecules while excluding others. Molecular sieve adsorbents find applications in a wide range of industries, including petroleum refining, gas separation, air purification, and chemical manufacturing. They are employed for processes such as drying, purification, and purification of feedstocks, removal of contaminants, and separation of gases based on their molecular sizes. The unique properties of molecular sieve adsorbents enable them to contribute to improved product quality, process efficiency, and environmental sustainability.

The major global manufacturers of Molecular Sieve Adsorbents include Honeywell

UOP, Arkema, Tosoh, W.R.
