Research Summary

Molybdenum-99 (Mo-99) is a radioactive isotope of molybdenum that plays a crucial role in nuclear medicine. It is primarily used as a parent isotope to produce technetium-99m (Tc-99m), which is the most commonly used medical radioisotope. Tc-99m is utilized in diagnostic imaging procedures such as single-photon emission computed tomography (SPECT) scans. Mo-99 is typically produced through the nuclear fission of uranium-235 targets in specialized reactors. These reactors are usually located at dedicated facilities that supply Mo-99 to radiopharmaceutical companies. Mo-99 has a relatively short half-life of about 66 hours, which necessitates efficient and timely distribution to medical facilities. However, the production and supply of Mo-99 have been a concern in recent years due to its reliance on aging reactors and the challenges associated with its transportation and handling. Efforts are underway to develop alternative production methods and improve the availability and accessibility of this critical medical radioisotope.

The major global manufacturers of Molybdenum-99 (Mo-99) include NRG, IRE, ANSTO,

NTP, Rosatom, etc. The global players competition landscape in this report is divided into three tiers.
