Research Summary

Molybdenum Disilicide (MoSi₂) heating elements are high-temperature resistance heating elements that are commonly used in industrial and laboratory furnaces. MoSi₂ is a refractory ceramic material known for its excellent electrical conductivity and high-temperature stability. These heating elements are typically manufactured in a rod or U-shaped configuration and can reach temperatures up to 1800°C (3272°F). MoSi₂ heating elements operate by passing electrical current through the material, which then generates heat by resistance. They have a unique self-repairing property, where a protective layer of silicon dioxide forms on the surface at high temperatures, providing oxidation resistance and increased durability. This allows MoSi₂ heating elements to maintain their performance and longevity even in harsh and oxidizing environments. They are widely used in applications such as sintering, annealing, heat treating, and other processes that require precise and high-temperature control. MoSi₂ heating elements offer advantages such as rapid heating and cooling rates, uniform heat distribution, long service life, and energy efficiency, making them a preferred choice in

demanding high-temperature heating applications.
