### Research Summary

Monosodium Glutamate (MSG) is a flavor enhancer that is commonly used in cooking and food preparation. It is the sodium salt of glutamic acid, an amino acid that occurs naturally in various foods such as meat, vegetables, and dairy products. MSG is typically produced through a fermentation process from certain carbohydrates or by the enzymatic synthesis of glutamic acid. It is used to enhance the savory or umami taste of food by stimulating the taste receptors on the tongue. MSG imparts a unique flavor that enhances the perception of other tastes and can be found in a variety of processed foods, sauces, soups, snacks, and restaurant dishes. While some individuals may experience symptoms such as headaches or flushing when consuming foods containing MSG, scientific evidence suggests that these reactions are rare and typically mild. However, as with any food ingredient, it is important for individuals with specific sensitivities or allergies to exercise caution and read food labels if they wish to avoid consuming MSG.

The major global manufacturers of Monosodium Glutamate (MSG) include Fufeng
