Research Summary

A motor stator and rotor are the two key components of an electric motor that work together to generate motion. The stator is the stationary part of the motor and typically consists of coils of wire wound around a core made of magnetic material. It generates a rotating magnetic field when electrical current is applied to the coils. The rotor, on the other hand, is the rotating part of the motor that is positioned inside the stator. It is usually made of conductive material, such as copper or aluminum, and is connected to the output shaft of the motor. The interaction between the magnetic field of the stator and the induced current in the rotor creates a force that causes the rotor to rotate, thus generating mechanical motion. The combined operation of the stator and rotor enables electric motors to power a wide range of devices, from household appliances to industrial machinery and vehicles.

The major global manufacturers of Motor Stator and Rotor include ABB, Wolong Electric, Siemens, Changying Xinzhi, Zhongshan Broad-Ocean Motor, Nidec, Long Sheng Technology, Zhejiang Founder Motor, TECO Electric, Changzhou Shenli
