Research Summary

Motorcycle Anti-lock Braking Systems (ABS) are safety systems designed to prevent the wheels of a motorcycle from locking up during braking, thereby helping the rider maintain control and stability. Similar to ABS systems found in cars, motorcycle ABS works by continuously monitoring the rotational speed of the wheels. When a potential lock-up is detected, the system modulates the brake pressure, rapidly applying and releasing the brakes to prevent skidding. This allows the rider to maintain steering control and prevents the motorcycle from overturning or sliding in hazardous situations such as emergency braking or when braking on slippery surfaces. Motorcycle ABS systems typically employ sensors, hydraulic modulators, and electronic control units to monitor and regulate the brake pressure. ABS provides significant benefits in terms of enhancing rider safety and reducing the risk of accidents caused by wheel lock-up, particularly in situations where the road conditions or rider inputs may lead to an abrupt loss of traction.

The major global manufacturers of Motorcycle Anti-lock Braking Systems include Bosch, Continental, Nissin, BWI, ADVICS, BMW, Honda, etc. The global players competition landscape in this report is divided into three tiers.
