### Research Summary

MRI (Magnetic Resonance Imaging) is a powerful medical imaging technique that uses a combination of strong magnetic fields and radiofrequency pulses to produce detailed, three-dimensional images of the human body. It provides valuable diagnostic information about the structure and function of internal organs, tissues, and the central nervous system without the use of ionizing radiation. MRI machines consist of a large cylindrical magnet that generates a strong magnetic field, a radiofrequency transmitter and receiver system, and a computer to process and display the acquired images. During an MRI scan, the patient lies inside the machine, and the magnet aligns the hydrogen atoms in the body's tissues. When radiofrequency pulses are applied, the aligned atoms emit signals that are detected by the receiver. By manipulating the magnetic field and timing the radiofrequency pulses, MRI can visualize different tissues based on their unique magnetic properties. The resulting images provide detailed anatomical information, and advanced techniques such as functional MRI (fMRI) can even capture dynamic processes like blood flow and brain activity. MRI is widely used in

medical diagnosis and evaluation of various conditions, including but not limited to neurological disorders, musculoskeletal injuries, cardiovascular diseases, and cancer staging.

The major global manufacturers of MRI (Magnetic Resonance Imaging System) include GE, Siemens, Hitachi, Philips, Toshiba, United Imaging, Neusoft, XGY, Anke, Alltech, WDM, etc. The global players competition landscape in this report is divided into three tiers.
