Research Summary

An MRI metal detector is a safety device used in magnetic resonance imaging (MRI) facilities to detect and identify metallic objects or implants on individuals before they enter the MRI scanner. MRI machines generate powerful magnetic fields, and metal objects can become dangerous projectiles or cause heating effects when brought into the scanner room. The metal detector typically consists of a handheld or walk-through device that emits low-frequency electromagnetic waves and measures the response from metal objects. When a metal object is detected, an audible or visual alarm is triggered, alerting the operator to the presence of metallic materials. This allows for the identification and removal of potentially hazardous objects, such as ferromagnetic tools, jewelry, implants, or other metallic items, ensuring the safety of both patients and staff during the MRI procedure. The use of MRI metal detectors is an important safety measure to prevent accidents and complications associated with the presence of metal near the MRI magnet.

The major global manufacturers of MRI Metal Detector include CEIA USA, ETS

Lindgren, ITEL Telecomunicazioni, Fujidenolo, Kopp Development, Metrasens, Biodexs, etc. The global players competition landscape in this report is divided into three tiers.
