Research Summary

Multi-Factor Authentication (MFA) is a security mechanism that requires users to provide multiple forms of identification before being granted access to a system, application, or digital account. It adds an extra layer of protection beyond just a username and password combination. MFA typically combines two or more of the following factors: something the user knows (such as a password or PIN), something the user has (such as a physical token or mobile device), or something the user is (such as biometric data like fingerprints or facial recognition). To authenticate, the user must provide valid information from multiple categories. This multi-factor approach significantly enhances security by reducing the risk of unauthorized access, as an attacker would need to compromise multiple factors to gain entry. MFA is widely used in various industries and applications, including online banking, email services, social media platforms, and corporate networks, to protect sensitive data and ensure the identity and privacy of users.

The major global suppliers of Multi-Factor Authentication (MFA) include Morpho,

Gemalto, NEC, Entrust Inc., Broadcom, Fujitsu, VASCO Data Security, HID Global, RSA Security, Symantec Corporation, SecurEnvoy Ltd, Crossmatch, Duo Security, Deepnet Security, CensorNet, etc. The global players competition landscape in this report is divided into three tiers.
