### Research Summary

Multibeam sonar is a type of underwater acoustic imaging technology used for mapping and surveying the seabed or underwater objects with high precision. It utilizes multiple acoustic beams simultaneously to capture a wide swath of the seafloor or water column. By emitting sound waves at various angles and receiving the echoes from multiple directions, the multibeam sonar system can create detailed and three-dimensional representations of underwater terrain, revealing the shape, depth, and texture of the seabed. The data collected by the multibeam sonar can be used for various applications, such as marine navigation, offshore exploration, underwater archaeology, environmental monitoring, and hydrographic surveys. Multibeam sonar systems provide efficient and accurate mapping capabilities, enabling researchers and marine professionals to study and understand underwater environments effectively.

The major global manufacturers of Multibeam Sonar include Kongsberg, Teledyne, Wartsila, Klein Marine Systems, Tritech, IXblue, WASSP, Imagenex, NORBIT, R2Sonic, etc. The global players competition landscape in this report is divided into three tiers.
