### Research Summary

Multiphoton laser scanning microscopy (MPLSM) is an advanced imaging technique that allows for high-resolution imaging of biological samples with minimal photodamage. It relies on the nonlinear interaction of photons to excite fluorophores in the sample, typically using an ultrafast laser source, such as a femtosecond laser. Unlike conventional confocal microscopy, MPLSM utilizes two or more photons to excite the fluorophores, resulting in improved depth penetration and reduced phototoxicity. The excitation occurs only at the focal point, which allows for precise three-dimensional imaging of thick samples, such as tissue or living organisms. MPLSM is widely used in various fields of biological research, including neuroscience, developmental biology, and cellular imaging, to visualize intricate structures and dynamic processes at the subcellular level with high spatial and temporal resolution.

The major global manufacturers of Multiphoton Laser Scanning Microscopy include ZEISS, OLYMPUS, Leica Microsystems, Nikon, Bruker, Thorlabs, Femtonics,

Scientifica, Sutter, etc. The global players competition landscape in this report is divided into three tiers.
