### Research Summary

NAND flash, short for “negative-AND flash,” is a type of non-volatile memory storage technology widely used in electronic devices such as solid-state drives (SSDs), USB flash drives, and memory cards. It is a form of flash memory that employs NAND logic gates to store and retrieve digital data. NAND flash is organized into a series of memory cells, each consisting of a floating-gate transistor and a control gate. These cells are arranged in a grid-like structure, with each cell capable of storing multiple bits of information. NAND flash memory allows for high-density storage, fast read and write speeds, and the ability to retain data even when power is disconnected. It is commonly used in consumer electronics, enterprise storage systems, and other applications that require durable, reliable, and high-capacity storage solutions.

The major global manufacturers of NAND Flash include Samsung Electronics, Toshiba/SanDisk, SK Hynix Semiconductor, Micron Technology, Intel Corporation, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading enterprises that command a substantial market share, hold a dominant industry position, possess strong competitiveness and influence, and

generate significant revenue. The second tier includes companies with a notable market presence and reputation; these firms actively follow industry leaders in product, service, or technological innovation and maintain a moderate revenue scale. The third tier consists of smaller companies with limited market share and lower brand recognition, primarily focused on local markets and generating comparatively lower revenue.
