Research Summary

Nano-coating refers to a thin film or layer of materials that are engineered at the nanoscale level, typically ranging from 1 to 100 nanometers in thickness. These coatings are applied to various surfaces, such as metals, glass, plastics, or textiles, to enhance their properties and provide additional functionalities. Nano-coatings are designed to have unique characteristics, including improved durability, scratch resistance, water repellency, chemical resistance, or anti-corrosion properties. The nanoscale structure of the coating allows for enhanced surface coverage and adhesion, resulting in better performance compared to traditional coatings. Additionally, nano-coatings can also provide optical properties like anti-reflective or anti-glare effects, as well as antimicrobial or self-cleaning properties due to their engineered surface chemistry. These coatings have applications in multiple industries, including automotive, electronics, healthcare, construction, and aerospace, to enhance the performance, lifespan, and aesthetics of various products and materials.

The major global manufacturers of Nano-coating include PPG, Akzonobel, Sherwin-Williams, RPM International, Axalta, BASF, Kansai Paint, Nanomech, EIKOS, Telsa
