Research Summary

Nanofiltration membrane is a type of filtration membrane that operates on the nanoscale level, providing selective separation and purification of substances based on their molecular size and charge. It is an intermediate membrane between ultrafiltration and reverse osmosis, with a pore size range typically between 1 and 10 nanometers. The nanofiltration membrane allows for the removal of divalent ions, organic molecules, and colloidal particles while retaining monovalent ions and smaller molecules. It is commonly used in water treatment processes, such as desalination, softening, and removal of organic compounds and micropollutants. Nanofiltration membranes offer advantages like high permeability, low energy consumption, and the ability to operate at lower pressures compared to reverse osmosis membranes. Their applications extend to various industries, including food and beverage, pharmaceuticals, and chemical processing, where selective separation and purification of molecules are required.

The major global manufacturers of Nanofiltration Membrane include Dupont, Nitto, TORAY, Suez Water Technologies, Vontron, Origin Water, Keensen, Jozzon Water,

Wave Cyber, Risingsun Membrane Technology, etc. The global players competition landscape in this report is divided into three tiers.
