### Research Summary

Nanosecond fiber lasers are a type of laser system that generate short pulses of laser light with durations on the order of nanoseconds ( $10^{-9}$  seconds). These lasers utilize fiber-optic technology, where the gain medium is a fiber doped with rare-earth ions such as erbium or ytterbium. The fiber serves as both the medium for optical amplification and the waveguide to guide and confine the light. Nanosecond fiber lasers are known for their high peak power, excellent beam quality, and stable output characteristics. They find applications in various fields, including laser marking, micromachining, material processing, scientific research, and telecommunications. The short pulse duration allows precise control and high-speed processing, enabling the removal or modification of material with minimal heat-affected zones. Nanosecond fiber lasers are favored for their compact size, robustness, energy efficiency, and versatility, making them a valuable tool in numerous industrial and scientific applications.

The major global manufacturers of Nanosecond Fiber Lasers include Trumpf, IPG Photonics, Newport Corp, Jenoptik, Wuhan Raycus, JPT Opto-electronics, MPB
