### Research Summary

A nasogastric tube (NG tube) is a flexible tube that is inserted through the nose, down the throat, and into the stomach. It is used for various medical purposes, including feeding, medication administration, and gastric decompression. The tube is typically made of soft, pliable material and comes in different sizes depending on the intended use. Nasogastric tubes are commonly employed when a patient is unable to consume food or medications orally or when there is a need to remove fluids or gas from the stomach. The placement of an NG tube is typically done by a healthcare professional, and it requires assessing the correct position through aspiration of stomach contents or using X-ray confirmation. Once properly inserted, the tube allows for the administration of liquid nutrition, medications, or the drainage of gastric contents, depending on the specific requirements of the patient. Regular monitoring and proper care are important when managing patients with nasogastric tubes to prevent complications and ensure the safe and effective delivery of treatment.

The major global manufacturers of Nasogastric Tube include Andersen Products, Bard
