### Research Summary

Natural and artificial feed antioxidants are substances used in animal nutrition to protect the feed and the animals from oxidative damage. Natural feed antioxidants are derived from plant sources, such as herbs, spices, fruits, and vegetables. They contain compounds like polyphenols, flavonoids, and vitamins that possess antioxidant properties. These natural antioxidants can help inhibit the formation of harmful free radicals in feed and the animal's body, reducing oxidative stress and supporting overall health. Examples of natural feed antioxidants include rosemary extract, green tea extract, and grape seed extract.

On the other hand, artificial feed antioxidants, also known as synthetic antioxidants or chemical antioxidants, are manufactured compounds designed to have antioxidant activity. They are typically added to animal feed to prevent lipid oxidation and preserve the quality and shelf life of feed ingredients. Common artificial feed antioxidants include butylated hydroxytoluene (BHT), butylated hydroxyanisole (BHA), and ethoxyquin. These compounds are effective at inhibiting oxidation, but some may have potential

health concerns and regulatory restrictions on their use.

Both natural and artificial feed antioxidants play a vital role in maintaining the nutritional value of animal feed and preventing oxidative damage. However, the trend in the animal feed industry is shifting towards the use of natural feed antioxidants, as they are perceived as more natural and sustainable alternatives to synthetic counterparts. Additionally, natural feed antioxidants often provide additional health benefits beyond their antioxidant properties, contributing to the overall well-being of animals.
