Research Summary

Naturally Occurring Radioactive Material (NORM) disposal and waste management refer to the processes involved in handling, storing, and disposing of materials that naturally contain radioactive elements. NORM can be found in various industries such as oil and gas production, mining, and certain manufacturing processes. The disposal and waste management of NORM typically involve several steps. Initially, the material is assessed to determine its radioactivity levels, potential hazards, and appropriate disposal methods. Depending on the specific characteristics and regulations, NORM waste may undergo treatment, such as encapsulation or solidification, to minimize radiation risks. Facilities and storage areas equipped with proper radiation shielding and monitoring systems are used to safely store NORM waste during designated periods. Ultimately, the final disposal of NORM waste may involve options like long-term storage in deep repositories or, in some cases, its controlled release into the environment within established regulatory limits. These disposal and waste management practices are

designed to ensure the protection of human health and the environment from the potential risks associated with naturally occurring radioactive materials.

The major global suppliers of Naturally Occurring Radioactive Material (NORM) Disposal & Waste Management include Waste Management, Veolia Group, Clean Harbors, Studsvik, Secure Energy, Stork, Terralog Technologies, Buckhorn Waste Services, Clym Environmental Services, etc. The global players competition landscape in this report is divided into three tiers.
