### Research Summary

Negative Temperature Coefficient Thermistors (NTC Thermistors) are electronic components that exhibit a decrease in resistance as the temperature increases. They are made from semiconductor materials with a negative temperature coefficient of resistance, meaning that their resistance decreases as the temperature rises. NTC thermistors are commonly used for temperature sensing and compensation in various applications. They are sensitive to small changes in temperature and offer a high degree of accuracy. NTC thermistors can be connected to a circuit or system, and their resistance can be measured to determine the temperature of the environment or to provide temperature compensation in electronic devices. They are widely utilized in industries such as automotive, consumer electronics, medical devices, and HVAC systems for temperature control, thermal protection, temperature monitoring, and temperature compensation purposes.
