Research Summary

A neonatal warmer, also known as an infant warmer or incubator, is a specialized medical device used to provide a controlled environment and maintain optimal body temperature for newborn infants, especially those born prematurely or with low birth weight. These warmers are designed to mimic the warmth and comfort of the mother's womb, creating a stable and regulated environment for the baby's growth and development. Neonatal warmers typically consist of a temperature-controlled bed or mattress, overhead heaters, and monitoring systems to assess vital signs. They provide a warm and safe space for newborns, protecting them from temperature fluctuations and ensuring their core body temperature remains within a narrow range. Neonatal warmers are commonly used in neonatal intensive care units (NICUs) and delivery rooms to stabilize the temperature of infants after birth, promote thermoregulation, and reduce the risk of complications associated with hypothermia. The warmers often have additional features, such as humidity control, access ports for medical interventions, and attachment points for monitoring equipment, to meet the specific needs of newborn care.
