Research Summary

Neuro-endoscopy is a minimally invasive surgical technique used to diagnose and treat a variety of conditions affecting the brain and nervous system. It involves the use of an endoscope, a thin, flexible tube with a light and camera attached to its tip, which is inserted through a small incision or natural body opening. The endoscope allows neurosurgeons to visualize the internal structures of the brain and perform surgical procedures with precision. Neuro-endoscopy is commonly used for procedures such as biopsy, tumor removal, cyst drainage, treatment of hydrocephalus, treatment of vascular abnormalities, and the management of certain neurological disorders. The minimally invasive nature of neuro-endoscopy offers benefits such as smaller incisions, reduced trauma to surrounding tissues, shorter hospital stays, faster recovery times, and decreased risk of complications compared to traditional open surgery. It has revolutionized the field of neurosurgery and continues to evolve, enabling patients to receive effective treatment with improved outcomes and quality of life.

The major global manufacturers of Neuro-Endoscopy include Rudolf, B.Braun, Carl
