Research Summary

A neuroendovascular coil is a medical device used in a procedure called endovascular coiling, which is a minimally invasive treatment for certain types of brain aneurysms. The coil is a small, soft, platinum wire that is delivered through a catheter into the blood vessel where the aneurysm is located. Once deployed, the coil is used to fill the aneurysm, promoting blood clotting and preventing rupture. The procedure is performed under fluoroscopic guidance, allowing the neurointerventional surgeon to navigate through the blood vessels and precisely place the coil within the aneurysm. Neuroendovascular coiling offers several advantages over traditional surgical clipping, including less invasive access, shorter recovery times, reduced risk of complications, and preservation of normal brain tissue. The use of neuroendovascular coils has revolutionized the field of neurovascular interventions and provided a less invasive treatment option for patients with certain types of brain aneurysms.

The major global manufacturers of Neuroendovascular Coil include Stryker, Codman (DePuy), MicroVention, Medtronic, Penumbra, etc. The global players competition
