Research Summary

Neurothrombectomy devices are specialized medical tools used in the treatment of acute ischemic stroke, specifically for removing blood clots from blocked blood vessels in the brain. Ischemic stroke occurs when a clot blocks the blood flow to a part of the brain, leading to a potentially serious and life-threatening condition. Neurothrombectomy devices are designed to restore blood flow by physically removing or extracting the clot from the affected blood vessel. These devices utilize various techniques, such as stent retrievers, aspiration catheters, and other mechanical devices, to navigate through the blood vessels of the brain and engage the clot. Once the clot is captured or engaged, the device is then used to remove it, enabling blood flow to be restored to the affected area of the brain. Neurothrombectomy has revolutionized the treatment of acute ischemic stroke, particularly for large vessel occlusion, and has significantly improved patient outcomes by reducing disability and improving survival rates. The procedure is typically performed by interventional neurologists or neuroradiologists in specialized stroke centers, and patient selection for neurothrombectomy is determined based on factors such as the type and location of the clot, time elapsed since stroke onset,

patient's clinical presentation, and imaging findings.

The major global manufacturers of Neurothrombectomy Devices include Stryker, Medtronic, Penumbra, Phenox, Acandis, etc. The global players competition landscape in this report is divided into three tiers.
