Research Summary

NEV IGBT modules heatsinks are components used in the cooling system of New Energy Vehicles (NEV) that utilize Insulated-Gate Bipolar Transistor (IGBT) modules. IGBTs are key elements in the power electronic circuits of NEVs, responsible for controlling and converting electrical power efficiently. These modules generate considerable heat during operation, which needs to be effectively dissipated to ensure optimal performance and reliability. Heatsinks are designed to absorb and disperse this heat away from the IGBT modules, preventing overheating and potential damage. NEV IGBT module heatsinks often feature finned structures, which increase the surface area for improved heat dissipation through convection. They are typically made of thermally conductive materials like aluminum or copper, chosen for their excellent thermal conductivity properties. The heatsinks work in conjunction with cooling fans or liquid cooling systems to maintain the IGBT modules at suitable operating temperatures, ensuring efficient power conversion and prolonging the lifespan of the electrical components in NEVs.

The major global manufacturers of NEV IGBT Modules Heatsink include Amulaire Thermal Tech, Semikron, Dana, DAU, Wieland Microcool, Advanced Thermal Solutions, Senior Flexonics, Real Thermal Management, etc. The global players competition landscape in this report is divided into three tiers.
