Research Summary

A new energy charging gun, also known as an electric vehicle (EV) charging gun, is a device used to supply electrical power to recharge the batteries of electric vehicles. These charging guns are typically connected to charging stations or outlets and are used by EV owners to replenish the energy stored in their vehicle's batteries. The charging gun consists of a handle with controls for initiating and stopping the charging process, as well as a connector at the end that plugs into the vehicle's charging port. Depending on the type of charging gun and the charging infrastructure, different charging standards and connector types may be used, such as Type 1, Type 2, CHAdeMO, or CCS (Combined Charging System). New energy charging guns can provide various levels of charging power, ranging from slow AC charging for overnight charging at home to fast DC charging for rapid charging at public charging stations. These charging guns play a crucial role in the adoption of electric vehicles by providing convenient and efficient means of recharging EV batteries.
