Research Summary

The New Energy Vehicle (NEV) traction motor core refers to the essential component within an electric vehicle's electric motor that primarily consists of magnetic materials. The core is responsible for creating the magnetic field required for the motor's operation. The NEV traction motor core is typically constructed using high-quality laminated iron or steel sheets, which reduce energy losses and improve the efficiency of the motor. The core is designed in a way that optimizes magnetic flux paths to enhance the motor's performance, torque output, and overall efficiency. It provides the structural and magnetic foundation for the motor's stator and rotor, enabling the conversion of electrical energy into mechanical energy to propel the vehicle. The NEV traction motor core is a critical component in electric vehicles, contributing to their power and efficient operation.
