### Research Summary

Nickel foam is a highly porous material made from nickel fibers or particles that are interconnected to form a three-dimensional structure resembling a net or sponge-like structure. It is commonly manufactured through a process called electrodeposition, where nickel is plated onto a conductive template or substrate, followed by the removal of the template material, leaving behind a foam-like structure. Nickel foam exhibits excellent properties such as high porosity, low density, good thermal conductivity, and corrosion resistance. These characteristics make it suitable for a wide range of applications, including catalysis, filtration, energy storage, aerospace, and electronics. Nickel foam is used as a catalyst support in various chemical reactions, as a current collector in batteries and fuel cells, and as a heat sink or thermal interface material in electronic devices. Its high surface area and open-cell structure allow for efficient gas or liquid flow, enhanced mass transfer, and heat dissipation.

The major global manufacturers of Nickel Foam include Hunan Corun, Alantum, Sumitomo Electric Industries, Wuzhou Sanhe New Material, Heze Tianyu Technology, Novamet Specialty Products, JIA SHI DE, Kunshan Jiayisheng, etc. The global players

competition landscape in this report is divided into three tiers.
