Research Summary

Nickel-Zinc (NiZn) batteries are a type of rechargeable battery that utilizes nickel oxide hydroxide (NiOOH) as the positive electrode and zinc metal (Zn) as the negative electrode. These batteries operate on a similar electrochemical principle as alkaline batteries but are rechargeable and offer higher energy density. NiZn batteries have a higher nominal voltage of around 1.6V per cell compared to 1.2V for NiMH (Nickel-Metal Hydride) and NiCd (Nickel-Cadmium) batteries, which can provide advantages in certain applications. They are known for their relatively high specific energy (energy per unit weight) and power density (rate of energy delivery), making them suitable for applications requiring high power output such as power tools, digital cameras, and electric vehicles. However, NiZn batteries can be sensitive to overcharging and require specific charging algorithms to maximize their lifespan and performance. Ongoing research and development aim to improve their cycle life and safety characteristics for broader commercial use.

The major global manufacturers of Nickel-Zinc Battery include ZincFive, Riot Energy, ANSMANN, SolarEdge, Turnigy, Chilwee, PKCELL, etc. The global players competition
