Research Summary

Nicotinamide, also known as NAA or niacinamide, is an essential water-soluble vitamin B3 derivative that plays a crucial role in various physiological processes within the human body. It is derived from niacin (vitamin B3) and can be produced in the body or obtained from dietary sources. Nicotinamide serves as a precursor for the production of nicotinamide adenine dinucleotide (NAD⁺), which is a coenzyme involved in many cellular metabolic reactions, including energy production, DNA repair, and cell signaling. NAA is known for its involvement in the metabolism of carbohydrates, fats, and proteins, as well as its contribution to the maintenance of healthy skin, nervous system function, and overall well-being. It is often used as a supplement or ingredient in various skincare products due to its potential benefits for reducing hyperpigmentation, improving skin tone and texture, and supporting the skin's barrier function. Additionally, nicotinamide has been studied for its potential therapeutic applications in treating certain medical conditions, such as niacin deficiency, pellagra, and acne.
