Research Summary

Niobium carbide is a compound composed of niobium (Nb) and carbon © atoms. It is classified as a refractory ceramic material due to its high melting point and resistance to heat. Niobium carbide has a hardness similar to that of tungsten carbide, making it a valuable material for applications requiring high wear resistance. It is commonly used in the production of cutting tools, such as drills and end mills, as well as in wear-resistant coatings for tools and components subjected to high temperatures and abrasive environments. Niobium carbide is also used in the field of nuclear energy as a coating material on nuclear fuel particles to improve their performance and stability. Additionally, it has potential applications in the development of superconducting materials and as a catalyst in certain chemical reactions. The properties of niobium carbide make it a versatile and essential compound in various industries where high strength, durability, and resistance to extreme conditions are required.

The major global manufacturers of Niobium Carbide include H.C. Starck, Kennametal, Japan New Metals, ESPI Metals, Jiujiang Tanbre, Zhuzhou Cemented Carbide Group,
