Research Summary

A non-contact dynamic torque sensor is a specialized device used to measure torque (rotational force) without physical contact with the rotating shaft or component. Unlike traditional torque sensors that rely on mechanical connections or strain gauges, non-contact dynamic torque sensors utilize non-contact measurement principles such as magnetic, optical, or capacitive sensing techniques. These sensors typically consist of two parts: a stationary sensor element and a rotating element attached to the shaft or component whose torque is being measured. The rotating element may contain magnets, reflective markers, or capacitive plates, depending on the sensing technology employed. As the shaft rotates, changes in magnetic fields, light reflection, or capacitance are detected by the stationary sensor, allowing for precise measurement of torque without introducing friction or altering the mechanical properties of the system. Non-contact dynamic torque sensors are widely used in various applications such as automotive testing, industrial machinery, aerospace, and research and development, where accurate and reliable torque measurement is essential for performance

optimization, quality control, and safety.

The major global manufacturers of Non-Contact Dynamic Torque Sensor include TE Connectivity, Lorenz Messtechnik, Sensor Technology Ltd, SCAIME, FUTEK Advanced Sensor Technology, Inc., SENSY, Datum Electronics, burster, BCM SENSOR, MAGTROL, HBM Test and Measurement, Honeywell Advanced Sensing Technologies, Interface, Inc., montronix, Mountz Inc, n-gineric, Schaeffler Technologies AG & Co.
