Research Summary

Non-contact tonometers are medical devices used to measure the intraocular pressure (IOP) of the eye without making direct contact with the cornea. They employ a non-contact method to assess and monitor IOP, which is an important parameter for diagnosing and managing conditions like glaucoma. Non-contact tonometers use a puff of air to deform the cornea momentarily, and then measure the change in curvature of the cornea to determine the IOP. This method is painless and does not require any anesthesia or eye drops, making it well-tolerated by patients. Non-contact tonometers are often used in routine eye examinations, as they provide a quick and reliable measurement of IOP. They are commonly found in optometrist offices, ophthalmology clinics, and hospitals, contributing to the early detection and management of ocular conditions.

The major global manufacturers of Non-Contact Tonometers include Topcon, Nidek, Reichert, Keeler (Halma), Carl Zeiss, Kowa, Tomey, Rexam, OCULUS, Canon, Huvitz, Diaton, Suwei, etc. The global players competition landscape in this report is divided
