Research Summary

A Non-volatile Dual In-Line Memory Module (NVDIMM) is a type of computer memory module that combines the characteristics of both volatile and non-volatile memory. It is designed to provide fast and persistent storage capabilities. NVDIMMs typically consist of dynamic random-access memory (DRAM) for volatile storage and non-volatile memory (NVM), such as flash memory or phase-change memory, for persistent storage. This configuration allows data to be stored in the NVDIMM even when the power is turned off, ensuring data durability. NVDIMMs offer the advantage of high-speed access and low latency typical of traditional DRAM while providing data persistence similar to solid-state drives (SSDs) or hard disk drives (HDDs). These memory modules are commonly used in enterprise servers, storage systems, and other applications that require both high-performance and data persistence, making them suitable for tasks such as caching, logging, and data backup.
