Research Summary

Nonanediamine, also known as 1,9-diaminononane or simply NDA, is an organic compound with the chemical formula $C_9H_{20}N_2$. It is a diamine, which means it contains two amino groups ($-NH_2$) attached to a nine-carbon alkane chain. Nonanediamine is primarily used as a building block or intermediate in the synthesis of various polymers, including nylon resins. PA9T, also known as polyamide 9T, is a thermoplastic polymer derived from nonanediamine and terephthalic acid. It is a high-performance engineering plastic known for its excellent thermal stability, mechanical strength, and chemical resistance. PA9T is used in a range of applications, including automotive components, electrical connectors, industrial equipment, and consumer goods where exceptional performance under high temperatures and harsh conditions is required. The combination of nonanediamine and terephthalic acid in PA9T results in a polymer with desirable properties, making it a valuable material in engineering applications.

The major global manufacturers of Nonanediamine and PA9T include Kuraray, BASF, etc. The global players competition landscape in this report is divided into three tiers.
