Research Summary

A NOx (nitrogen oxide) sensor is a device used for measuring the concentration of nitrogen oxides in gases emitted from combustion processes, typically in automotive applications. NOx refers to the collective term for nitrogen oxide gases, including nitrogen monoxide (NO) and nitrogen dioxide (NO₂), which are harmful air pollutants contributing to air pollution and the formation of smog. The NOx sensor is designed to detect and quantify the levels of these gases in the exhaust gases of vehicles. It operates based on electrochemical principles and contains a sensing element that reacts with nitrogen oxides, generating an electrical signal proportional to the concentration of NOx present. This signal is then used by the engine control unit (ECU) to optimize combustion and control emissions, helping to meet environmental regulations and improve overall vehicle performance. The NOx sensor plays a crucial role in achieving cleaner and more environmentally friendly combustion processes in vehicles.

The major global manufacturers of NOx Sensor include Continental, Bosch Mobility Solutions, NGK, Dorman, ACDelco, etc. The global players competition landscape in
