### Research Summary

An oil mist separator, also known as an oil mist collector or oil mist eliminator, is a device used to capture and remove oil mist or oil droplets from the air in industrial processes. It is commonly employed in applications where processes or machinery generate oil mist as a byproduct, such as machining operations, metalworking processes, and lubricant systems. The oil mist separator works by utilizing a combination of filtration and separation techniques to trap and separate the oil droplets from the airflow. Typically, the mist-laden air is passed through a series of filters or coalescing media that capture and collect the oil particles, allowing clean air to be discharged back into the environment. The collected oil is usually drained or recycled for further use. Oil mist separators play a crucial role in maintaining a clean working environment, preventing oil contamination, and ensuring the health and safety of workers. They also help in reducing maintenance requirements, extending the lifespan of equipment, and complying with environmental regulations.

The major global manufacturers of Oil Mist Separator include Donaldson, Absolent,
