Research Summary

On-chip color filters are integrated components used in image sensors, such as those found in digital cameras, smartphones, and other imaging devices, to filter light and capture color information. These filters are applied directly onto the sensor's surface, typically over individual photodetectors, in the form of a grid of red, green, and blue filters, which correspond to the primary colors of light. The purpose of these color filters is to allow the sensor to capture different wavelengths of light, with each filter allowing only specific colors to pass through, thus enabling the sensor to create full-color images. On-chip color filters are essential in the process of color image reconstruction, as they help the sensor differentiate between the various color components of light, which are then combined through image processing algorithms to produce the final color image. These filters provide a compact and efficient way to enhance image quality, improve color accuracy, and reduce the need for external optical components, making them a critical feature in modern image sensing technologies.

The major global manufacturers of On-Chip Color Filters include Sony, Samsung,

Toppan, etc. The global players competition landscape in this report is divided into three tiers.
