Research Summary

An on-line water quality monitoring system is a comprehensive network of sensors, instruments, and software designed to continuously assess the quality and safety of water in real-time. These systems are commonly used in water treatment plants, distribution networks, and natural water bodies to monitor a range of parameters, including pH, turbidity, dissolved solids, and various contaminants. The data collected is transmitted to a central control system where it is analyzed and used to make real-time decisions to ensure that water quality meets regulatory standards and safety requirements. On-line water quality monitoring systems play a crucial role in safeguarding public health, protecting ecosystems, and efficiently managing water resources by providing early detection of pollution events, optimizing water treatment processes, and supporting informed decision-making for water management.
