Research Summary

Oral Cone Beam Computed Tomography (CBCT) is a specialized medical imaging technique used in dentistry and maxillofacial surgery. It provides high-resolution 3D images of a patient's oral and facial structures, including teeth, bones, and soft tissues. Unlike traditional dental X-rays, CBCT captures detailed images in a single rotation, offering dentists and oral surgeons a comprehensive view of the patient's oral anatomy. This technology is particularly valuable in planning complex dental procedures, such as implant placement, orthodontics, and diagnosing issues like impacted teeth, dental infections, and jaw disorders. CBCT imaging minimizes radiation exposure, improves treatment precision, and enhances patient care by enabling more accurate diagnosis and treatment planning in the field of oral and maxillofacial surgery.
